Abstract of DE 19646372 (C1)

Compound comprises a structural unit A (genotype) and a further structural unit B (phenotype), in which the genotype and phenotype are permanently linked to each other, where structural unit A exhibits, besides other regions, 1-1 region coding for 1-1 polymeric molecule constructed from amino acid units and the coding regions are translatable, and furthermore a first structural subunit (terminator) is located in an untranslated section of structural unit A, which permanently links structural unit B as a translation product of structural A to structural unit A.
